

AgPay

Payment infrastructure for agriculture.

A vertical fintech platform for agri-commerce: checkout, escrow, settlement, ledger, contract financing, and trusted payment workflows.

APPLICATION WEDGES

MeatLovers.ca
consumer commerce

DealerMaster
B2B livestock

Agriculture needs payment rails that understand real-world conditions.

- **High-value transactions**

Cattle lots and bulk produce — five and six figures per deal.

- **Multi-party settlement**

Producer, processor, dealer, marketplace, lender — all paid correctly.

- **Variable final pricing**

Final weights, grades and shrink change the number after the sale.

- **Embedded credit & contract terms**

Finance contracts, interest, staged payments baked into the deal.

- **Trust, inspection & delivery**

Money should move on weights, grades, inspection and delivery — not blind checkout.

THE PROBLEM

The pain is not payments alone. It is payment + proof + settlement.

Today, sellers stitch the rest together by hand:

AgPay collapses order → hold → validate → settle into one workflow with a built-in ledger.

Start with checkout. Add workflows as complexity grows.

Merchants adopt checkout first, then layer on escrow, settlement, ledger, financing and verification.

MeatLovers.ca — a freezer-box checkout becomes a live AgPay environment.

Local meat boxes

Deposits & pre-orders

Batch allocation

Processor timing

Producer relationships

Customer trust

A simple consumer checkout already exercises deposits, escrow, final-weight reconciliation, and split settlement.

Customer → AgPay → MeatLovers → Processor → Producer.

AgPay sits in the middle and applies the right rule at each hop:

Deposit

Escrow option

Final-weight reconciliation

Split settlement

Platform fee

DealerMaster already models the money. AgPay moves it.

What AgPay adds:

- Payment links for invoices · Vendor payouts / cheque replacement
- Escrow for cattle transactions · Contract-receivable collections
- Financing-partner integration

Financed cattle sales become a serviceable receivable.

- Customer buys on a finance contract instead of paying up front.
- Invoice routes to a Contract Sales receivable (not regular AR).
- A contract ledger tracks PURCHASE, PAYMENT and INTEREST.

Monthly interest — journal entry

Dr Contract Sales receivable
Cr Interest Income

Worked example

Financed sale	\$100,000
Less payment	– \$1,000
Balance	\$99,000
Annual rate	7.45% (6.95% prime + 0.5%)
Monthly interest	$\$99,000 \times 7.45\% \div 12 = \614.62
New balance	\$99,614.62

Balance-enforced postings become AgPay triggers.

Event	Debit	Credit
AP purchase	Inventory · GST/HST Receivable	Accounts Payable
Payment made	Accounts Payable	Cash / Bank
AR sale	Accounts Receivable	Sales · GST/HST Collected
Payment received	Cash / Bank	Accounts Receivable
Monthly interest	Contract Sales receivable	Interest Income

Every posting is balance-enforced. AgPay uses these financial events to trigger collection, payout, escrow release, reconciliation and lender reporting.

Domain apps stay focused. AgPay standardizes the money.

Workflow-specific financial infrastructure — not a commodity processor.
